

“ **Simple** and **Robust system** for Smart Cargo Handling ”

Power system on board

**VSDS** stands for "**Variable Speed Drive System.**" It's a technology used to control the speed of motors by varying the frequency and voltage of the power supplied to them. This helps improve energy efficiency, reduce wear and tear, and allows for better control over processes.

Vessels equipped with these two technologies, **Smart pumping** and **Full Drive System**, are cavitation-free and guarantee unparalleled efficiency when used correctly. We guarantee it with an **industry first 7-year warranty.**

[ Traditional ] VSDS

**Matrix**

[ New release ] VSDS

**Full Drive**

“ We listen to the customers for **solving weakpoints** ”

- More difficult to learn, understand and troubleshoot.
- During discharge, not all the pumps are running at the same time.
- Large amount of small supporting parts makes the system more vulnerable.
- A breakdown of cabling / components can affect a large part of the system.
- A communication fault in a matrix can disable the entire matrix until resolved.

**70~80%**  
reduction in  
components

**+/- 15%**  
Less cooling  
power required

**Up to 66%**  
Footprint  
reduction

- Easy to learn and understand.
- More space for cable installation.
- Lower Standby power requirement.
- Prepared for AI machine learning.
- No elevated platform required under the drives.
- Minimum training requirements due to intuitive UI.
- Decreased commercial risk for the operator.
